

# DIE KERAMIK, DIE DEN CORONAVIRUS UND BAKTERIEN BEKÄMPFT\*

BAUEN WIR GEMEINSAM EINE BESSERE ZUKUNFT

Die bahnbrechende ADVANCE®Keramik ist für Böden und Wandverkleidungen. Sie garantiert einen hohen Schutz der Oberflächen und gesündere Räume. Dies geschieht anhand der antiviralen und antibakteriellen Eigenschaften dieser Keramik, sowie anhand ihrer Fähigkeit die Schadstoffe zu bekämpfen.

**ADVANCE®: Bauen wir gemeinsam eine bessere zukunft .**

\*Unter Belichtung kann ADVANCE® bereits nach 15 Minuten 90% der Coronaviren beseitigen und schon nach sechsstündiger Belichtung 100%. Nach einer achtstündigen Belichtung bekämpft ADVANCE® die unterschiedlichen Typen von Bakterien um mindestens 95% bis zu 100%. Die mit ADVANCE® geführten Labortests sind auf der Internetseite [www.advanceceramic.it/de](http://www.advanceceramic.it/de) einsehbar.

ADVANCE® steht für umweltfreundliche Bodenbeläge und Wandverkleidungen aus Feinsteinzeug. Dieses Feinsteinzeug wird im Einbrandverfahren bei einer Brenntemperatur von über 1200 Grad hergestellt.

ADVANCE® besteht für 40% aus recycelten Materialien undes ist sowohl für den Wohnbereich als auch für gewerbliche Anwendungen geeignet. Die innovative Technologie von ADVANCE® istdank ihrer antiviralen, antibakteriellen und photokatalytischen Eigenschaften in der Lage, unsere Umgebung gesünder zu machen und die Schadstoffbelastung erheblich zu reduzieren.

# ZUKUNFT, NATUR, WISSENSCHAFT

AUS DEM ENGAGEMENT DER ITALCER-GRUPPE UND IHRER RÜKSICHTNAHME AUF DIE UMWELT UND DEN SOZIALEN BEREICH IST ADVANCE® ENTSTANDEN. DIESES NEUE PROJEKT SPIEGELT AUCH IHREN WILLEN WIDER, DER ZUKUNFT MIT EINER INNOVATIVEN, IM EINBRANDVERFAHREN HERGESTELLTEN KERAMIK ENTGEGENZUGEHEN: IHRE ANTIVIRALEN, ANTIBAKTERIELLEN UND PHOTOKATALYTISCHEN EIGENSCHAFTEN SIND IN DER LAGE, DIE GESENDHUT ZU SCHÜTZEN UND DIE UMWELTVERSCHMUTZUNG ZU REDUIZIEREN.

Zukunft, Natur, Wissenschaft  
unsere Inspiration

ITALCER GROUP

Unsere wichtigste Inspirationsquelle ist die ZUKUNFT, denn wir träumen von einer Welt, in der die kommenden Generationen immer nachhaltigere Materialien verwenden können, durch die es unserem Planeten besser geht, indem mögliche Kontaminationen durch Mikroorganismen und damit den Einsatz umweltschädlicher chemischer Reinigungsmittel reduziert werden. Wir verwenden in erster Linie SnO<sub>2</sub> (Zinndioxid) und TiO<sub>2</sub> (Titandioxid) in biomimetischer Form: sie werden mit Prozessen gewonnen, in denen die Mechanismen der NATUR repliziert werden. Die Synthese erfolgt bereits im ersten Brennvorgang, anhand einer innovativen Produktionstechnik, die das Ergebnis einer revolutionären Forschungsarbeit im Bereich der WISSENSCHAFT der Materialien ist.

Pierres des Châteaux

FLOOR: Chambord 100x100 (40"x40") Nat. Ret.

ADVANCE® ist eine innovative Technologie, eine hygienische und gleichzeitig umweltfreundliche Keramik. Diese neue Generation von Feinsteinzeug, Ergebnis einer langjährigen Forschungsarbeit, wurde in Zusammenarbeit mit Prof. Isidoro Lesci und dank beachtlicher Investitionen in unseren Labors entwickelt.

ADVANCE® trägt zur Eliminierung von Viren, Bakterien und schädlichen Mikroorganismen bei und wirkt der gesundheits- und umweltschädlichen Umweltverschmutzung entgegen.

Die antiviralen und antibakteriellen Eigenschaften des Keramikmaterials tragen entscheidend dazu bei, alle Arten von Viren und Bakterien sowie andere Mikroorganismen zu eliminieren, die nicht nur für die Umwelt, sondern auch für unsere Gesundheit schädlich sind.

Eine Innovation, die es ermöglichen wird, private Wohnungen und öffentliche Bereiche sicherer und gesünder zu machen, mit einer rund um die Uhr garantierten Hygiene, durch die auch der Einsatz von chemischen Substanzen und Reinigungsmitteln drastisch reduziert werden kann.

## FORSCHUNG UND INNOVATION

Unsere Forschungsarbeit beginnt im Jahre 2018, mit dem Ziel **Keramikoberflächen** im Einbrandverfahren **antiviral, antibakteriell und schadstoffmindernd zu machen.**

Mit großer Begeisterung und viel Stolz können wir heute sagen, dass wir hier hervorragende Resultate erzielen konnten: durch die innovative Formulierung eines im Einbrandverfahren bei extrem hohen Temperaturen aufgebrachten Bioverbundstoffes wird das **Wachstum von Viren und Bakterien auf der Keramikoberfläche unterbunden.**

Nach einer ersten experimentellen Phase im Labor haben wir das industrielle Verfahren auf die Produktionsanlagen unserer Gruppe übernommen. Die von uns erzielten Resultate wurden zur Bestätigung der tatsächlichen Merkmale von akkreditierten Labors geprüft. Das **TCNA** (Tile Council of North America) hat die antiviralen Eigenschaften (ISO18061:2014(E) für den CoronaVirus 229E) und die **antibakteriellen Eigenschaften** (ISO 27447:2019(E)) der ADVANCE®-Technologie bestätigt.

Die **schadstoffmindernden** Eigenschaften (UNI 11484) wurden von der Universität Turin, Fachbereich Chemie bescheinigt.

Die antibakteriellen Eigenschaften des Produkts ADVANCE® wurden auch von der Universität Ferrara bestätigt, während die photokatalytischen Eigenschaften von der Universität Turin bescheinigt wurden.

Die Normen ISO 18061:2014(E) und ISO 27447:2019(E) beschreiben die Methode, an die sich die Tests zur Bestimmung der antiviralen und antibakteriellen Eigenschaften photokatalytischer Materialien halten müssen. Die Norm UNI 11484 beschreibt dagegen die Methode zur Bestimmung der Fähigkeit der Reduzierung von gasförmigem Stickstoffmonoxid (NO) mittels photokatalytischer Wirkung.

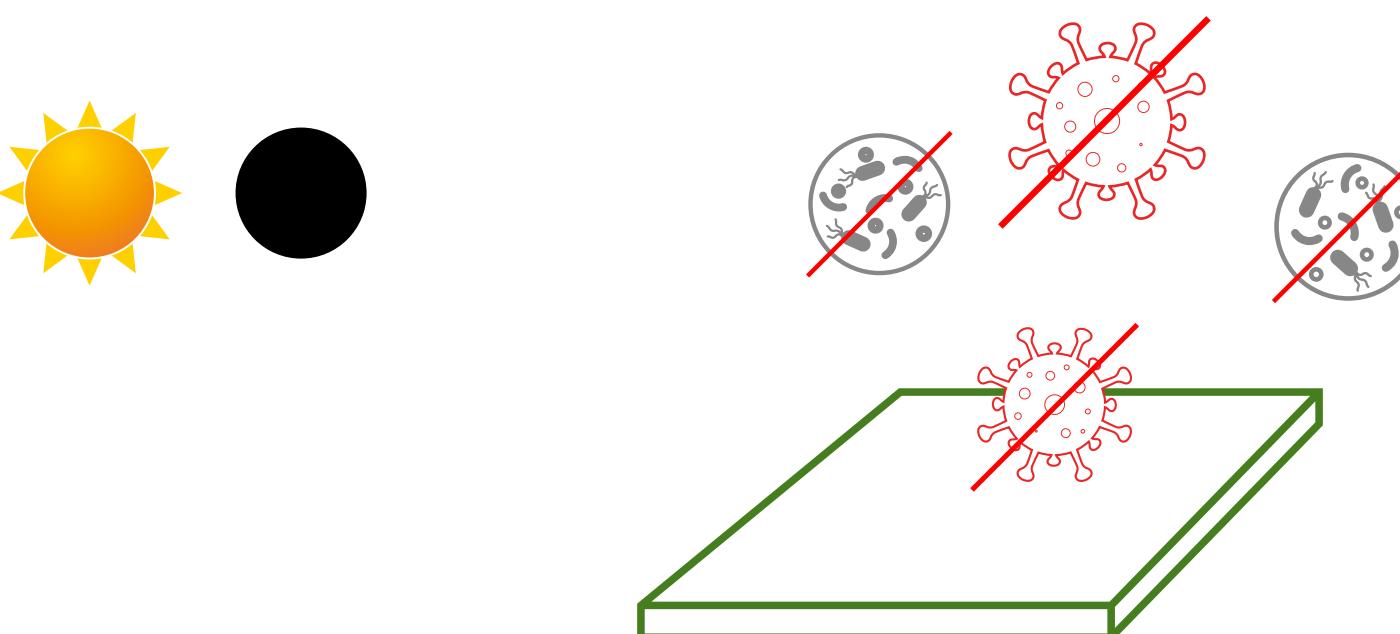

Il Cerreto

FLOOR: Champagne 23x149 (9"x58 1/2") Nat. Ret.

Die besondere Zusammensetzung dieses Feinsteinzeugs ermöglicht es, Viren und Bakterien abzutöten, die mit der Keramikoberfläche in Kontakt kommen.

ADVANCE® kann sowohl für Bodenbeläge als auch für Wandverkleidungen aus Keramik verwendet werden, und besitzt im Einbrandverfahren erzielte, antimikrobielle und photokatalytische Eigenschaften. Die Merkmale, die dieses Feinsteinzeug zu einem Produkt der neuesten Generation machen, werden während der ersten Herstellungsphase in die Keramik integriert (Einbrandverfahren bei über 1200°C). So werden sie zu natürlichen Produkteigenschaften, die die Fliesen während ihrer gesamten Lebensdauer gegen Viren und Bakterien schützen, ohne dass sie im Laufe der Zeit oder durch externe Faktoren beeinflusst werden. Da es sich nicht um eine Oberflächenschicht sondern um eine in die Keramik integrierte Eigenschaft handelt, bleibt diese auch langfristig unversehrt bestehen.

Die antiviralen und antibakteriellen Eigenschaften werden durch jede Art von Licht – sowohl Sonnenlicht als auch Kunstlicht – verstärkt, doch wie Tests renommierter Labors bestätigen, bleiben diese Eigenschaften auch ohne Lichteinfall aktiv.

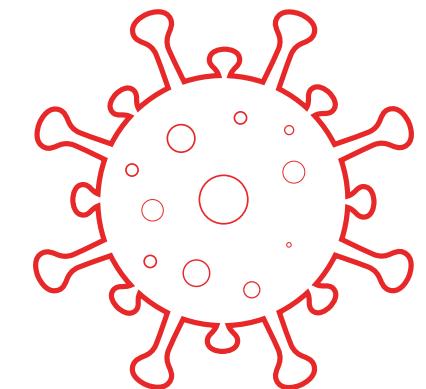

\*Bei den in der Tabelle angegebenen Bedingungen und mit den nachfolgenden Testergebnissen.

# EIGENSCHAFTEN

## 3 - REDUZIERTE UMWELTVERSCHMUTZUNG

UNI 11484

BESCHEINIGUNG DES FACHBEREICHS  
CHEMIE DER UNIVERSITÄT TURIN

-20,7% di NOx

FLÜCHTIGE SCHADSTOFFE WERDEN IN  
UNBEDENKLICHE STOFFE UMGEWANDELT.

Die schadstoffmindernden Eigenschaften des Feinsteinzeugs ADVANCE® verbessern auch die Qualität unserer Atemluft.

Die industrielle Produktion, der Einsatz von Klimaanlagen und die Transportmittel tragen zum Ausstoß von Schadstoffen in die Luft bei. Durch die Verwendung von **ADVANCE®** in Außenbereichen, an den Fassaden von Wohnungen und Gebäuden, können die NOx-Moleküle (Stickstoffoxid) in nur drei Stunden um 20,7% reduziert werden (laut Bescheinigung der Universität Turin). Durch die von natürlichem Licht aktivierte photokatalytische Wirkung kann die Qualität der Luft so beachtlich verbessert werden.

Alle mit ADVANCE® realisierten Outdoor-Lösungen tragen zu einer Verbesserung unserer Umwelt bei.

Diese Technologie ist nicht nur sicher für unsere Gesundheit, sondern auch eine nachhaltige und umweltfreundliche Entscheidung, da sie einen einzigen Brennvorgang bei extrem hohen Temperaturen vorsieht, ohne Notwendigkeit nachfolgender Behandlungen und damit ohne weitere Umweltauswirkungen.

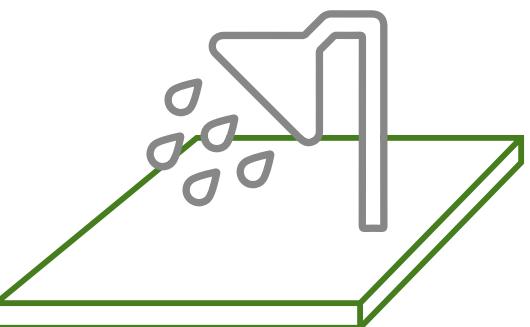

## EIGENSCHAFTEN

### 4 - BEKÄMPFT SCHMUTZ

**Reduziert den Einsatz chemischer Reinigungsmittel.**

Der Schmutz zersetzt sich auf den Keramikoberflächen von ADVANCE®. So können Bodenbeläge und Wandverkleidungen einfach mit Wasser und einem neutralen Reinigungsmittel sauber gehalten werden.

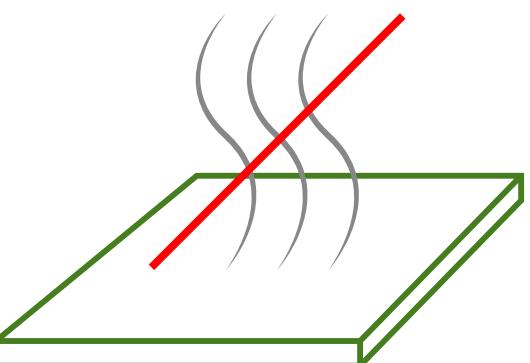

Bei Bodenbelägen im Außenbereich garantiert bereits das Abfließen von Regenwasser eine ausreichende Reinigung.

### 5 - HEMMT ÜBLE GERÜCHE

**Verwandelt organische Moleküle und reduziert so üble Gerüche.**

Ebenso wie die NOx-Moleküle zersetzen sich auch die für üble Gerüche verantwortlichen Moleküle, sobald sie mit der Oberfläche in Kontakt kommen und hemmen somit die Geruchsbildung.

## ANWENDUNGSBEREICHE – SICHERHEIT UND HYGIENE

Mit ADVANCE® will Italcer Group dazu beitragen, die Gesundheit und die Sicherheit der Ambiente zu verbessern, sowohl im öffentlichen als auch im privaten Bereich, durch Verkleidung aller Arten von Oberflächen in Wohnbereichen, Gesundheitsinstituten, Schulen, Flughäfen sowie in Gemeinschaftsräumen im Innen- und Außenbereich mit dieser innovativen Keramik.

Dank seiner natürlichen Eigenschaften verschönert ADVANCE® nicht nur das Ambiente, sondern es macht das auch gesund und hygienisch, für die Gesundheit und das Wohlbefinden von uns allen.

For a perfect result, we recommend you use wedges during laying.  
Per un risultato ottimale si consiglia di utilizzare durante la posa i cunei.  
Nous conseillons d'utiliser les coins durant la pose pour un résultat optimal.  
Für ein ausgezeichnetes Ergebnis wird empfohlen, bei der Verlegung die Keile zu verwenden.  
Para obtener un resultado optimizado se aconseja utilizar las cuñas durante la colocación.

The colours, structures, and patterns of the tiles illustrated in the catalogue might not correspond exactly to the actual product.  
Le cromie, le strutture e le grafiche delle piastrelle riprodotte nelle immagini del catalogo potrebbero non corrispondere fedelmente al prodotto industriale.  
Les tonalités, les structures et les graphismes des carreaux reproduits sur les images du catalogue ne pas correspondre parfaitement au produit industriel.  
Es ist möglich, dass die im Katalog abgebildeten Fliesen in Bezug auf Farbton, Struktur und Grafik vom Industrierzeugnis abweichen.  
Las estructuras, los colores y las gráficas de las baldosas reproducidas en las imágenes del catálogo podrían no coincidir fielmente con el producto industrial.

La Fabbrica S.p.A. reserves the right to make any changes it deems fit in order to improve the product, without prior notice.  
All images are provided for illustrative purposes only and other colours and aesthetic features are available.  
La Fabbrica S.p.A. si riserva di apportare, senza alcun preavviso, le modifiche che riterrà più opportune al fine di migliorare il prodotto.  
Quanto riportato è da considerarsi indicativo e non esauritivo in riferimento ai colori e alle caratteristiche estetiche dei prodotti.  
La Fabbrica S.p.A. se réserve le droit d'apporter, sans préavis, les modifications qu'elle jugera opportunes afin d'améliorer le produit.  
Les informations ci-dessous sont fournies à titre indicatif et elles ne sont pas contraignantes en ce qui concerne les couleurs et les caractéristiques esthétiques des produits.  
Die Firma La Fabbrica S.p.A. behält sich vor, ohne jegliche vorherige Ankündigung jene Änderungen vorzunehmen, die sie zur Verbesserung des Produktes für angebracht hält.  
Die Angaben sind bezüglich der Farben und ästhetischen Eigenschaften der Produkte als Richtwerte und nicht als vollständig anzusehen.  
La Fabbrica S.p.A. se reserva la posibilidad de introducir, sin obligación de aviso previo, las modificaciones que considere más indicadas para mejorar el producto.  
Las cualidades del material presentado deben considerarse de modo genérico, no siendo exhaustivas en cuanto a los colores y a las características estéticas de los productos.

**TCNA TEST REPORT NUMBER:** TCNA-0002-21 **PAGE:** 1 OF 4

**TEST REQUESTED BY:**  
Italcer  
Attn: Elena Vandelli  
Via Emilia Ovest 53/a  
Rubiera, 42048  
ITALY

**TEST SUBJECT MATERIAL:** Identified by client as: "Product name:  
Gold - Royal Stone collection - Italcer Group"

**TEST DATE:** 10/21/2020 - 1/8/2021

**TEST PROCEDURE:**  
*ISO 18061:2014(E): Fine Ceramics (Advanced Ceramics, Advanced Technical Ceramics) — Determination of antiviral activity of semiconducting photocatalytic materials.*  
Test method was modified to test with Human Coronavirus 229E.

**TEST VIRUSES AND CELL LINES:**

Virus	Cell line
Human Coronavirus 229E ATCC VR-740	MRC-5 ATCC CCL-171

**ASTM Guidance on SARS-CoV-2 Surrogate Selection:**

Surrogates of SARS-CoV-2 used in this testing are Human Coronavirus 229E and OC43. Surrogates were selected based on guidance provided by ASTM E35 Committee for Pesticides, Antimicrobials, and Alternative Control Agents. Further information on surrogate selection guidance provided by ASTM can be found here – [https://www.astm.org/COMMIT/GuidanceCOVID19SurrogateSel\\_April242020press.pdf](https://www.astm.org/COMMIT/GuidanceCOVID19SurrogateSel_April242020press.pdf)

**TEST CONDITIONS:**

Test sample size: 50 mm x 50 mm  
Volume of test suspension applied on test sample: 0.15 mL  
Infectivity titer of virus:  $10^6$  TCID50/mL  
Exposure conditions: UV irradiation and Dark conditions  
Exposure time: 30 minutes to 8 hours  
Environmental conditions for UV exposure: Temperature at  $25^\circ\text{C} \pm 1$   
RH  $\geq 90\%$   
UV exposure intensity: 0.25 mW/cm<sup>2</sup>  
UV lamp: Interlight F40 T10/BLB 130V 40W  
UV light radiometer: Mannix UV340

### Rapporto di Prova / Test report N. 002/Cfr AV2020

Data/ Date: 10/09/2020

Revisione 1 / Updated 1: 30/11/2020

Revisione 2 / Updated 2: 30/11/2020

### ISO 27447:2019 (E)

*Measurement of antibacterial activity on plastics and other non-porous surfaces*

**Committente / Customer:** GRUPPO ITALCER Via Emilia Ovest 53/A 42048 Rubiera (Reggio Emilia)

**Campione/ Sample:** Serie Advance, linea Royal Stone – Gold. /  
*Advance series, Royal Stone - Gold line.*

### Introduzione / Introduction

#### ISO 27447:2019. Fine ceramics (advanced ceramics, advanced technical ceramics) – Test method for antibacterial activity of semiconducting photocatalytic materials.

La norma specifica un metodo di prova è generalmente applicabile ai materiali photocatalitici e a prodotti con effetto antibatterico. La tipologia di materiali può essere di diversa caratteristica, ad esempio materiali utilizzati nei materiali da costruzione, quali ceramici photocatalitici o semiconduttori in lamiera piana, cartone, a forma di lastra o tessuti che sono le forme di base dei materiali per varie applicazioni.

*The standard specifies a test method is generally applicable to photocatalytic materials and products with an antibacterial effect. The type of materials can be of different characteristics, for example materials used in building materials, such as photocatalytic ceramics or semiconductors in flat sheet, cardboard, sheet shape or fabrics which are the basic shapes of materials for various applications.*

### Sommario: / Abstract:

Questa norma internazionale specifica un metodo di prova per la determinazione dell'attività antibatterica di materiali che contengono un photocatalizzatore o hanno pellicole photocatalitiche sulla superficie, misurando il conteggio dei batteri sotto l'irradiazione della luce ultravioletta.

*This International Standard specifies a test method for the determination of the antibacterial activity of materials that contain a photocatalyst or have photocatalytic films on the surface, by measuring the enumeration of bacteria under irradiation of ultraviolet light.*

in collaborazione con Prof. Pier Giorgio Balboni  
incarico di insegnamento come cultore della materia  
"Microbiologia" dell'Università di Ferrara

### Termini e Definizioni / Terms and Definitions

#### Fotocatalizzatore

sostanza che svolge molte funzioni basate su reazioni di ossidazione e riduzione sotto irradiazione ultravioletta (UV), compresa la decomposizione e la rimozione di contaminanti dell'aria e dell'acqua, deodorizzazione e azione antibatterica, autopulente e antiappannante.

#### Photocatalyst

*substance that carries out many functions based on oxidation and reduction reactions under ultraviolet (UV) irradiation, including decomposition and removal of air and water contaminants, deodorization, and antibacterial, self-cleaning and antifogging actions.*

#### Antibatterico

condizione che inibisce la crescita di batteri sulla superficie di materiali o panni a superficie piana.

#### Antibacterial

*condition inhibiting the growth of bacteria on the surface of flat surface materials or cloths.*

#### Valore dell'attività antibatterica del photocatalizzatore per il metodo di adesione del film

differenza tra il numero totale di batteri vitali dei materiali a superficie piana trattati photocatalitici e dei materiali non trattati dopo l'irradiazione UV.

#### Photocatalyst antibacterial activity value for film adhesion method

*difference between the total number of viable bacteria of photocatalytic treated flat surface materials and non- treated materials after UV irradiation.*

#### Lampada UV fluorescente

lampada che fornisce l'irradiazione UV-A entro un intervallo di lunghezze d'onda da 300 nm a 400 nm

#### Fluorescent UV lamp

*lamp that provides UV-A irradiation within a wavelength range of 300 nm to 400 nm*

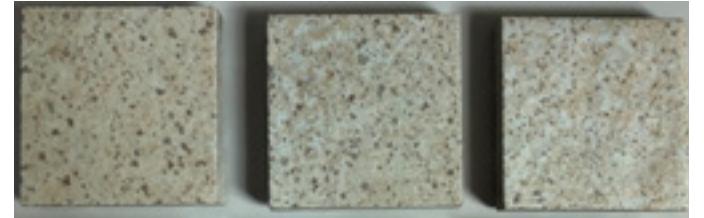

#### Attività antibatterica

differenza nel logaritmo della conta delle cellule vitali rilevata su un prodotto trattato con antibatterico e un prodotto non trattato dopo l'inoculazione e l'incubazione dei batteri test.

#### antibacterial activity.

*difference in the logarithm of the viable cell counts found on an antibacterial-treated product and an untreated product after inoculation with and incubation of bacteria.*

f) CONCLUSIONI / CONCLUSIONS:

Il metodo test secondo le condizioni di prova specificate nella norma ISO 27447:2019 determina la sopravvivenza del ceppo batterico test (*Escherichia coli* ATCC 8739) sulla superficie di provini di materiale ceramico, denominato **Serie Advance, linea Royal Stone - Gold (ITALCER)**, sottoposto a irraggiamento con UV per 8 ore, dimostrando che la riduzione batterica è pari al 98,4%.

È possibile concludere in base ai requisiti e metodo della ISO 27447:2019 che il materiale ceramico photocatalitico Serie Advance, linea Royal Stone - Gold (ITALCER), presenta una significativa attività inibitoria (antimicrobica) nei confronti del ceppo batterico *Escherichia coli* dopo irraggiamento UV.

Il campione Serie Advance, linea Royal Stone - Gold, trattato ad attività photocatalitica nei confronti del non trattato, senza irraggiamento UV e mantenuto al buio per 8 ore, rileva attività antimicrobica e presenta una riduzione antibatterica pari al 96,5%.

According to the test conditions specified in the ISO 27447: 2019 standard The test method determines the survival of the bacterial test strain (*Escherichia coli* ATCC 8739) on the surface of specimens of ceramic material, Advance series, Royal Stone – Gold line (ITALCER), radiated with UV rays for 8 hours, inducing bacterial reduction equal to 98,4%.

According to the requirements and method of ISO 27447: 20019 it can be concluded that the photocatalytic ceramic material Advance series, Royal Stone – Gold line (ITALCER) has a significant inhibitory (antimicrobial) activity against the bacterial strain *Escherichia coli* after UV irradiation.

Sample Advance series, Royal Stone – Gold line, treated with photocatalytic activity against the untreated, without UV irradiation and kept in the dark for 8 hours, has antimicrobial activity and shows a antibacterial reduction of 96,5%.

Advance series, Royal Stone - Gold line.

#### Introduzione / Introduction

#### ISO 27447:2019. Fine ceramics (advanced ceramics, advanced technical ceramics) – Test method for antibacterial activity of semiconducting photocatalytic materials.

La norma specifica un metodo di prova è generalmente applicabile ai materiali photocatalitici e a prodotti con effetto antibatterico. La tipologia di materiali può essere di diversa caratteristica, ad esempio materiali utilizzati nei materiali da costruzione, quali ceramici photocatalitici o semiconduttori in lamiera piana, cartone, a forma di lastra o tessuti che sono le forme di base dei materiali per varie applicazioni.

Il Metodo e i requisiti ISO 27447 riguardano il ceppo di prova, *Staphylococcus aureus*, e l'intensità della luce UV (0.25 mW/cm<sup>2</sup>).

*The standard specifies a test method is generally applicable to photocatalytic materials and products with an antibacterial effect. The type of materials can be of different characteristics, for example materials used in building materials, such as photocatalytic ceramics or semiconductors in flat sheet, cardboard, sheet shape or fabrics which are the basic shapes of materials for various applications.*

*According ISO 27447 the method and requirements concern the test strains, such as *Staphylococcus aureus*, and the intensity of UV light (0.25 mW/cm<sup>2</sup>).*

#### Sommario: / Abstract:

Questa norma internazionale specifica un metodo di prova per la determinazione dell'attività antibatterica di materiali che contengono un photocatalizzatore o hanno pellicole photocatalitiche sulla superficie, misurando il conteggio dei batteri sotto l'irradiazione della luce ultravioletta.

*This International Standard specifies a test method for the determination of the antibacterial activity of materials that contain a photocatalyst or have photocatalytic films on the surface, by measuring the enumeration of bacteria under irradiation of ultraviolet light.*

#### Termini e Definizioni / Terms and Definitions

##### Fotocatalizzatore

sostanza che svolge molte funzioni basate su reazioni di ossidazione e riduzione sotto irradiazione ultravioletta (UV), compresa la decomposizione e la rimozione di contaminanti dell'aria e dell'acqua, deodorizzazione e azione antibatterica, autopulente e antiappannante.

##### Photocatalyst

*substance that carries out many functions based on oxidation and reduction reactions under ultraviolet (UV) irradiation, including decomposition and removal of air and water contaminants, deodorization, and antibacterial, self-cleaning and antifogging actions.*

##### Antibatterico

condizione che inibisce la crescita di batteri sulla superficie di materiali o panni a superficie piana.

##### Antibacterial

*condition inhibiting the growth of bacteria on the surface of flat surface materials or cloths.*

##### Valore dell'attività antibatterica del photocatalizzatore per il metodo di adesione del film

differenza tra il numero totale di batteri vitali dei materiali a superficie piana trattati photocatalitici e dei materiali non trattati dopo l'irradiazione UV.

##### Photocatalyst antibacterial activity value for film adhesion method

*difference between the total number of viable bacteria of photocatalytic treated flat surface materials and non- treated materials after UV irradiation.*

##### Lampada UV fluorescente

lampada che fornisce l'irradiazione UV-A entro un intervallo di lunghezze d'onda da 300 nm a 400 nm

##### Fluorescent UV lamp

*lamp that provides UV-A irradiation within a wavelength range of 300 nm to 400 nm*

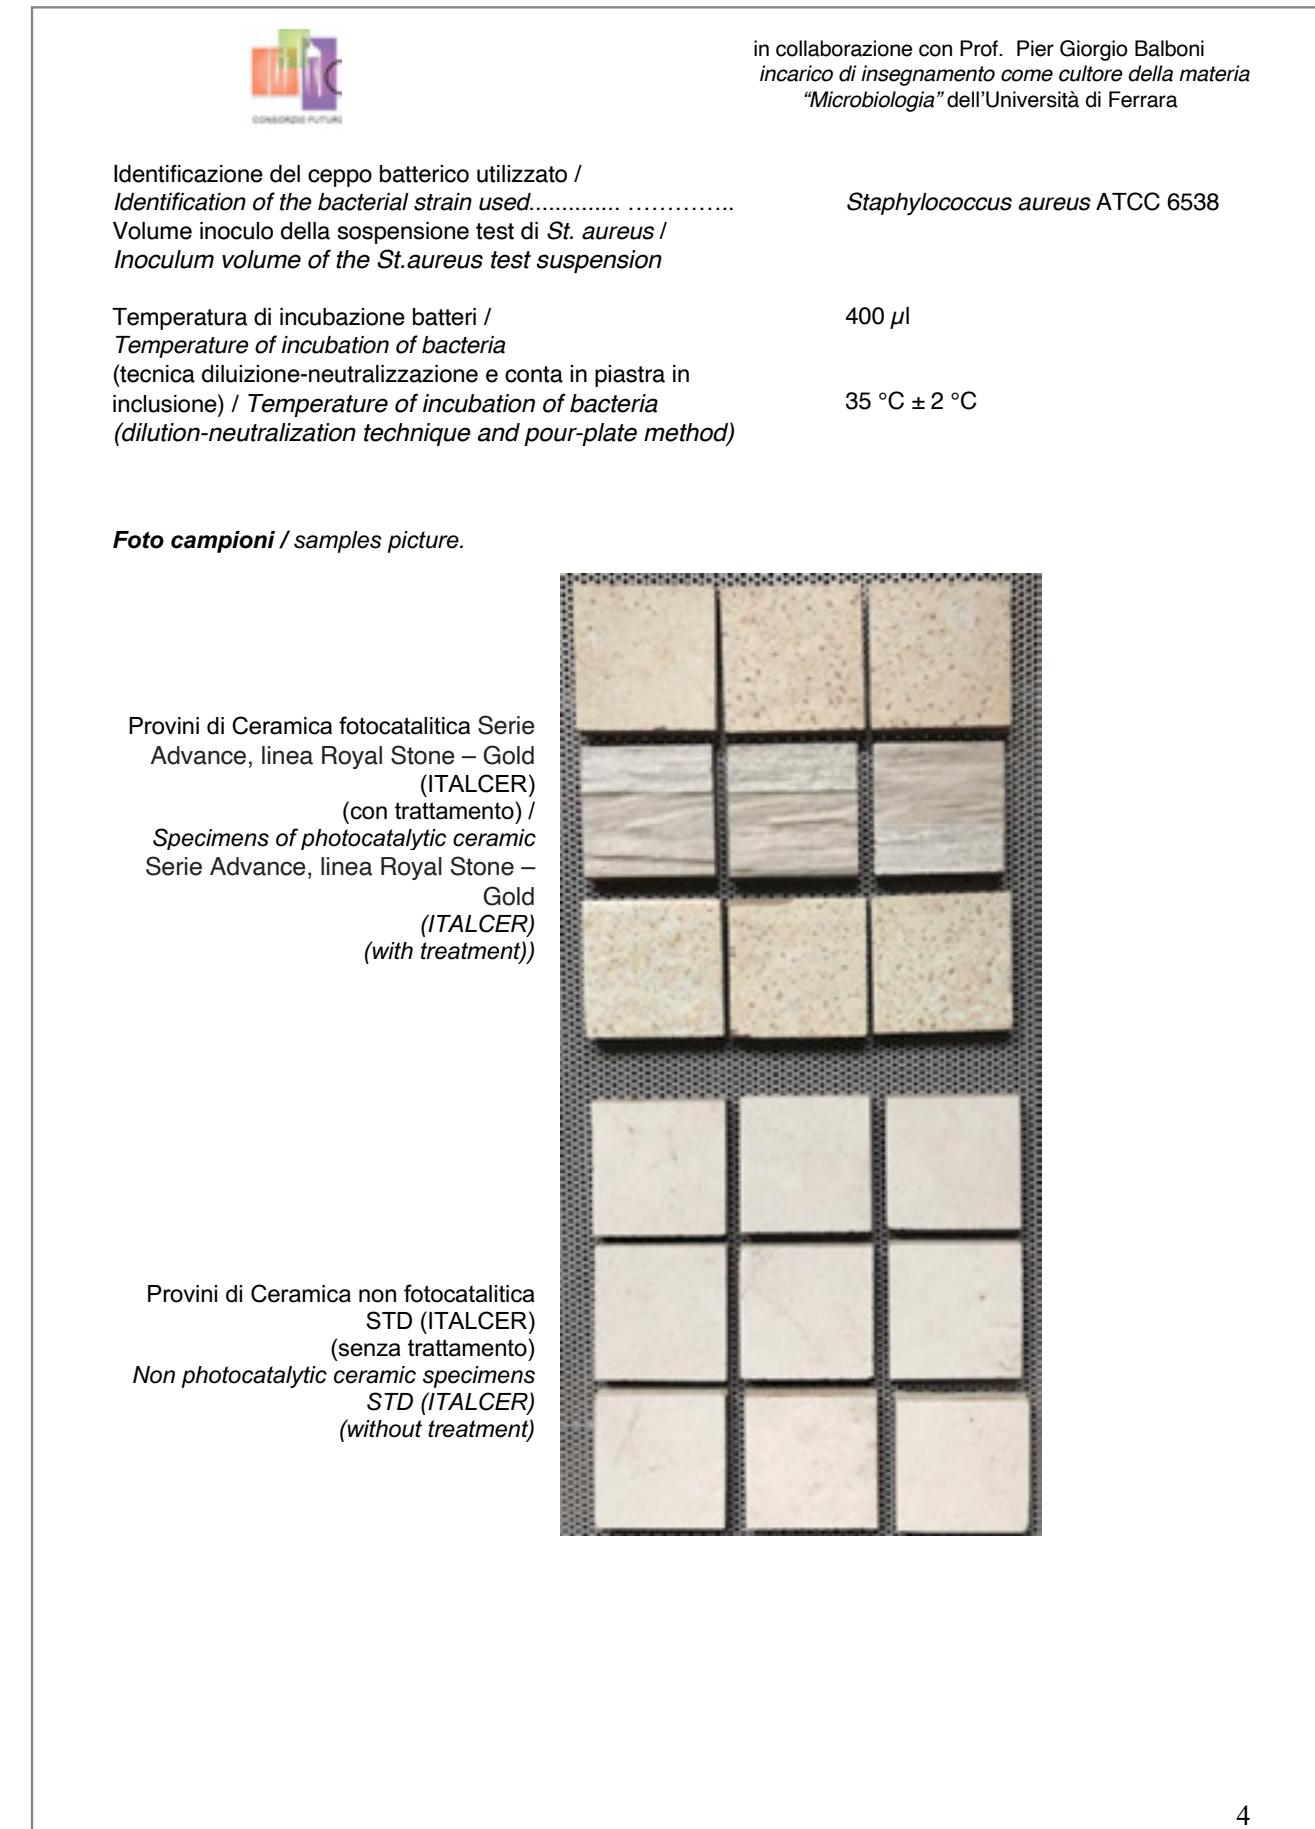

##### Attività antibatterica

differenza nel logaritmo della conta delle cellule vitali rilevata su un prodotto trattato con antibatterico e un prodotto non trattato dopo l'inoculazione e l'incubazione dei batteri test.

##### antibacterial activity

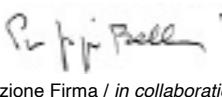

*difference in the logarithm of the viable cell counts found on an antibacterial-treated product and an untreated product after inoculation with and incubation of bacteria.*

## 1. GENERAL TEST CONDITIONS

The photocatalytic NO/NO<sub>x</sub> abatement tests were carried out using the method described in UNI 11484 (Determination of photocatalytic activity with a tangential continuous flow method - Abatement of nitric oxide - March 2013). The method follows the European Union technical specification CEN/TS 16980-1:2016 “Continuous flow methods – Part 1: Determination of NO in the air by photocatalytic materials”. The tests were carried out with a simplified procedure, i.e. when the condition of stability of the concentrations measured under irradiation was reached or the maximum irradiation time was reached (according to the UNI 11484 180 minutes), the flow rate was not changed within the reactor, thus ending the test under these conditions. The irradiance was in UV 10 W m<sup>-2</sup> from 290 to 400 nm), e in deroga sotto irraggiamento visibile.

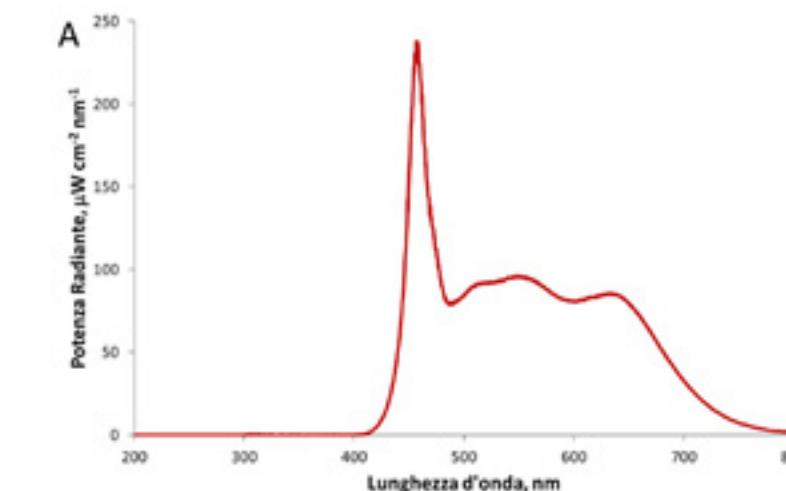

The determination of the NO/NO<sub>2</sub> content in the flow was carried out using an APNA 370 chemiluminescence detector (serial number WWSBNNW6). The measuring reactor had an internal volume of 3.6 dm<sup>3</sup>. The mixing inside the reactor was guaranteed by a compact axial fan EBMPAPST 612 JH (dimensions 60×60×32 mm) that provides a nominal flow equal to 70 m<sup>3</sup> h<sup>-1</sup>.

The irradiation took place with two different irradiation systems. In the first case, according to the indications of the UNI 11484 standard, the sample was irradiated in the UV by means of a set of two Philips PL-S 9W/2P BLB fluorescent lamps whose emission spectrum is shown in **Figure 1**. The intensity of the radiation incident on the sample was 10 W m<sup>-2</sup> between 290 and 400 nm.

**Figure 1.** Emission spectrum of the Philips PL-S 9W / 2P BLB lamp. The radiant power was measured in the same position in which the sample is housed by placing the Pyrex glass cover for closing the measuring reactor between the lamp and the sample.

In the case of Visible irradiation, at variance with the standard UNI 11484, it was used a LED illuminator (6500 K color temperature), assembled at the laboratories of the Department of Chemistry of the University of Turin, devoid of UV emission. The spectrum of this source (**Figure 2**) was characterized as shown below. The irradiance on the sample surface was **250 W m<sup>-2</sup>** between **400 and 800 nm**.

**Figure 2.** Emission spectrum of the LED lighting system (6500 K color temperature). The radiant power was measured in the same position in which the sample is housed by placing the Pyrex glass cover for closing the measurement reactor between the lamp and the sample.

The irradiance at the surface of the samples was evaluated spectroradiometrically with the two employed irradiation systems, through the use of an Ocean Optics USB2000 + UV-VIS spectrophotometer equipped with an optical fiber having a diameter of 400 μm and length equal to 30 cm, and a cosine corrector (Ocean Optics CC-3-UV-T, PTFE optical diffuser, spectral range 200-2500 nm, external diameter 6.35 mm, field of view 180 °). The spectroradiometer was calibrated with an Ocean Optics DH-2000-CAL Deuterium-Halogen Light Source for UV-Vis-NIR measurements, calibrated in turn in absolute irradiance by the seller (Radiometric Calibration Standard UV-NIR, calibration certificate # 2162).

## 2. SAMPLES

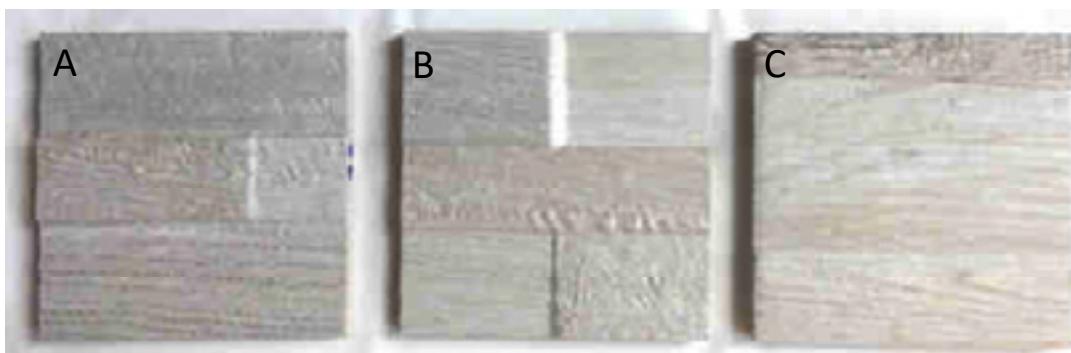

The samples (delivered directly by the client to UNITO on 21/05/2019) are 3 ceramic tiles (labeled AR, BR, CR, respectively, with dimensions 9.9 cm × 9.9 cm × 10 mm) with a potentially photoactive white paint deposited on one of the faces, whose photocatalytic properties are the subject of this document.

The tests in accordance with the UNI 11484 standard ("simplified" test) were performed on the samples as such **without any pretreatment**. The tests in accordance with the UNI 11484 standard, but with Visible radiation took place on the samples used for the test under UV radiation, but after washing with demineralized water and drying at 90 °C.

The list of tested samples, with the respective irradiated surface area and an indication of the type of radiation used during the test, is reported in **Table 1**. The pictures of the tested samples are shown in **Figure 3**.

**Table 1.** Samples analyzed

Sample	Sample description	Irradiation	Test	Area, cm <sup>2</sup>	Pretreatment
AR (UV)	Ceramic tile	UV	NO/NO <sub>x</sub> , UNI 11484:2013	98.0	NO
BR (UV)	Ceramic tile	UV	NO/NO <sub>x</sub> , UNI 11484:2013	98.0	NO
CR (UV)	Ceramic tile	UV	NO/NO <sub>x</sub> , UNI 11484:2013	98.0	NO
AR(Vis)	Ceramic tile	Visible	NO/NO <sub>x</sub> , UNI 11484:2013 (Visible)	98.0	Washing with water after test in UV
BR(Vis)	Ceramic tile	Visible	NO/NO <sub>x</sub> , UNI 11484:2013 (Visible)	98.0	Washing with water after test in UV
CR(Vis)	Ceramic tile	Visible	NO/NO <sub>x</sub> , UNI 11484:2013 (Visible)	98.0	Washing with water after test in UV

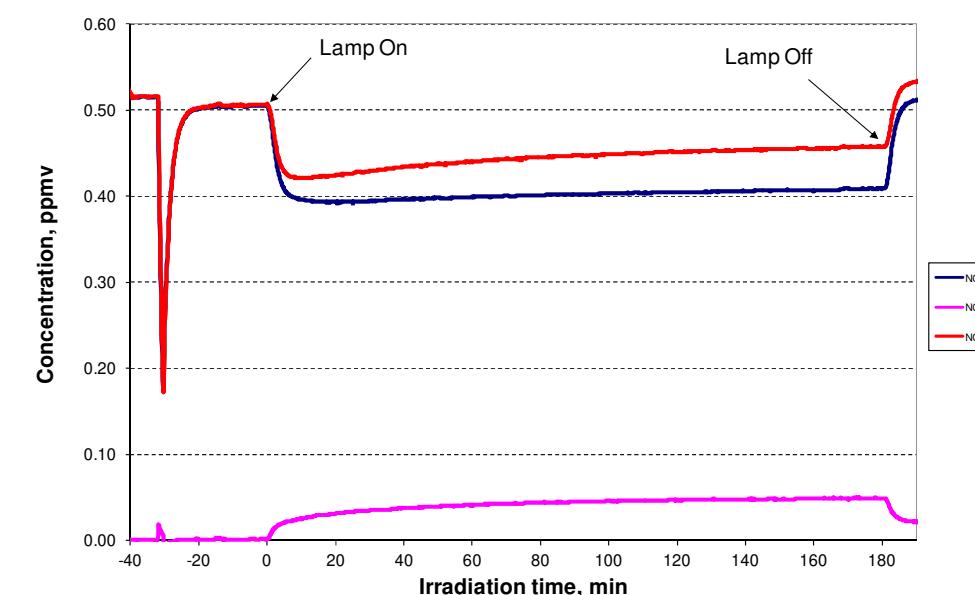

**Figure 3.** Pictures of the samples tested according to UNI 11484:2013: A = AR, B = BR, C = CR . The sample face reported is the irradiated one (UV and Visible irradiation) during the photocatalytic NO / NO<sub>x</sub> abatement tests.

### 3. EXPERIMENTAL RESULTS AND MEASURING CONDITIONS

#### 3.1. Sample "AR" (UNI 11484, UV)

The following table shows the operating conditions used in the test and its results.

Initial concentration of nitrogen oxides before entering the reactor	$C_{NO}^{IN} = 0.515 \text{ ppmv}$
	$C_{NO_x}^{IN} = 0.000 \text{ ppmv}$
Gas flow	$F = 1.608 \text{ dm}^3 \text{ min}^{-1}$
Temperature inside the reactor	$T = 29.2 \text{ }^\circ\text{C}$
Relative humidity inside the reactor	$HR\% = 45.1$
Irradiance of the lamp to the sample surface (290-400 nm)	$I = 10 \text{ W m}^{-2}$
Time elapsed between the time the UV lamp is switched on and the start of the concentration recording	31.5 min
Conversion in the absence of sample	$C_{NO}^{OUT,BUJO} = 0.5036 \text{ ppmv}$ $C_{NO_x}^{OUT,BUJO} = 0.016 \text{ ppmv}$ $C_{NO}^{OUT,LUCE} = 0.4972 \text{ ppmv}$ $\eta_{NO,luce}^{foto} = 1.3 \%$
Conversion in the dark in the presence of a sample	$\eta_{NO,luce}^{luce} = 2.0 \%$ $\eta_{NO_x}^{luce} = -0.2 \%$
Conversion under radiation in the presence of a sample	The graph showing the evolution of the concentrations during the various test steps is shown in <b>Figure 4</b> .
Observed rate of photocatalytic degradation	See <b>Table 2</b>
Remarks	<i>none</i>

**Figure 4.** Concentration vs time for NO, NO<sub>2</sub> and NO<sub>x</sub> during the photocatalytic test on AR (UV) sample. Test dated 29-05-2020 and performed with UV irradiation in accordance with UNI 11484 (simplified).

### 3.2. Sample "BR" (UNI 11484, UV)

The following table shows the operating conditions used in the test and its results.

Initial concentration of nitrogen oxides before entering the reactor	$C_{NO}^{IN} = 0.509 \text{ ppmv}$
	$C_{NO_2}^{IN} = -0.002 \text{ ppmv}$
Gas flow	$F = 1.608 \text{ dm}^3 \text{ min}^{-1}$
Temperature inside the reactor	$T = 28.4 \text{ }^\circ\text{C}$
Relative humidity inside the reactor	$HR\% = 44.1$
Irradiance of the lamp to the sample surface (290-400 nm)	$I = 10 \text{ W m}^{-2}$
Time elapsed between the time the UV lamp is switched on and the start of the concentration recording	31.5 min
Conversion in the absence of sample	$C_{NO}^{OUT,BUJO} = 0.5036 \text{ ppmv}$ $C_{NO_2}^{OUT,BUJO} = 0.016 \text{ ppmv}$ $C_{NO}^{OUT,LUCE} = 0.4972 \text{ ppmv}$ $\eta_{NO,photo} = 1.3 \%$
Conversion in the dark in the presence of a sample	$\eta_{NO,photo}^{buio} = -1.0 \%$ $\eta_{NO_2,photo}^{buio} = 0.1 \%$
Conversion under radiation in the presence of a sample	The graph showing the evolution of the concentrations during the various test steps is shown in Figure 5.
Observed rate of photocatalytic degradation	See Table 2
Remarks	none

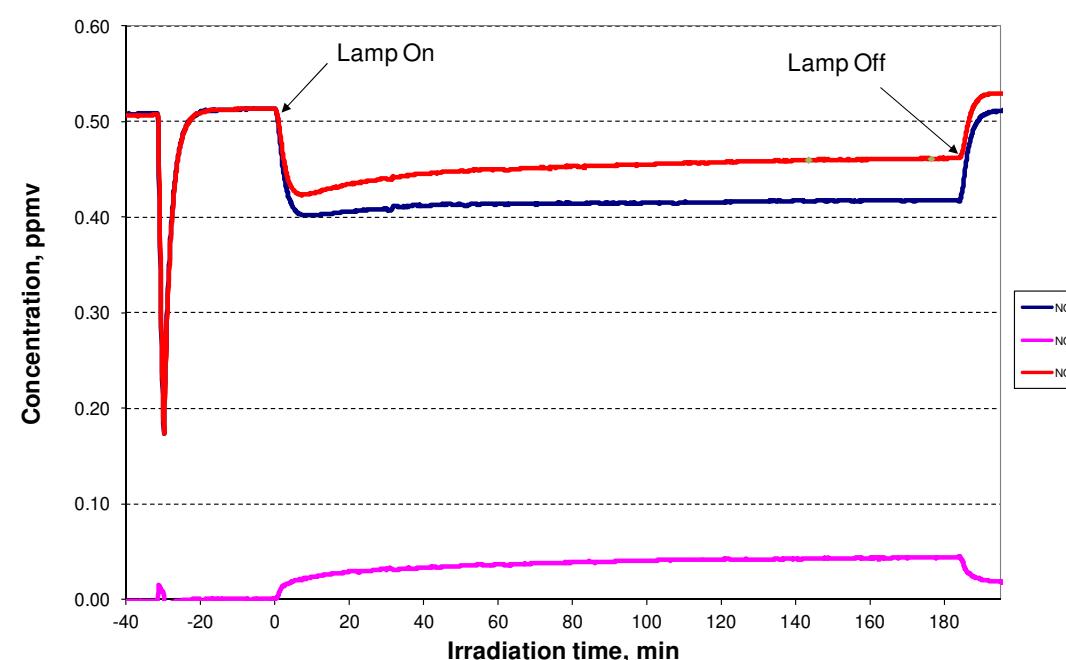

Figure 5. Concentration vs time for NO, NO<sub>2</sub> and NO<sub>x</sub> during the photocatalytic test on BR (UV) sample. Test dated 01/06/2020 and performed with UV irradiation in accordance with UNI 11484 (simplified).

### 3.3. Sample "CR" (UNI 11484, UV)

The following table shows the operating conditions used in the test and its results.

Initial concentration of nitrogen oxides before entering the reactor	$C_{NO}^{IN} = 0.513 \text{ ppmv}$
	$C_{NO_2}^{IN} = 0.000 \text{ ppmv}$
Gas flow	$F = 1.608 \text{ dm}^3 \text{ min}^{-1}$
Temperature inside the reactor	$T = 28.7 \text{ }^\circ\text{C}$
Relative humidity inside the reactor	$HR\% = 43.4$
Irradiance of the lamp to the sample surface (290-400 nm)	$I = 10 \text{ W m}^{-2}$
Time elapsed between the time the UV lamp is switched on and the start of the concentration recording	30.5 min
Conversion in the absence of sample	$C_{NO}^{OUT,BUJO} = 0.5036 \text{ ppmv}$ $C_{NO_2}^{OUT,BUJO} = 0.016 \text{ ppmv}$ $C_{NO}^{OUT,LUCE} = 0.4972 \text{ ppmv}$ $\eta_{NO,photo} = 1.3 \%$
Conversion in the dark in the presence of a sample	$\eta_{NO,photo}^{buio} = 2.1 \%$ $\eta_{NO_2,photo}^{buio} = 1.5 \%$
Conversion under radiation in the presence of a sample	The graph showing the evolution of the concentrations during the various test steps is shown in Figure 6.
Observed rate of photocatalytic degradation	See Table 2
Remarks	none

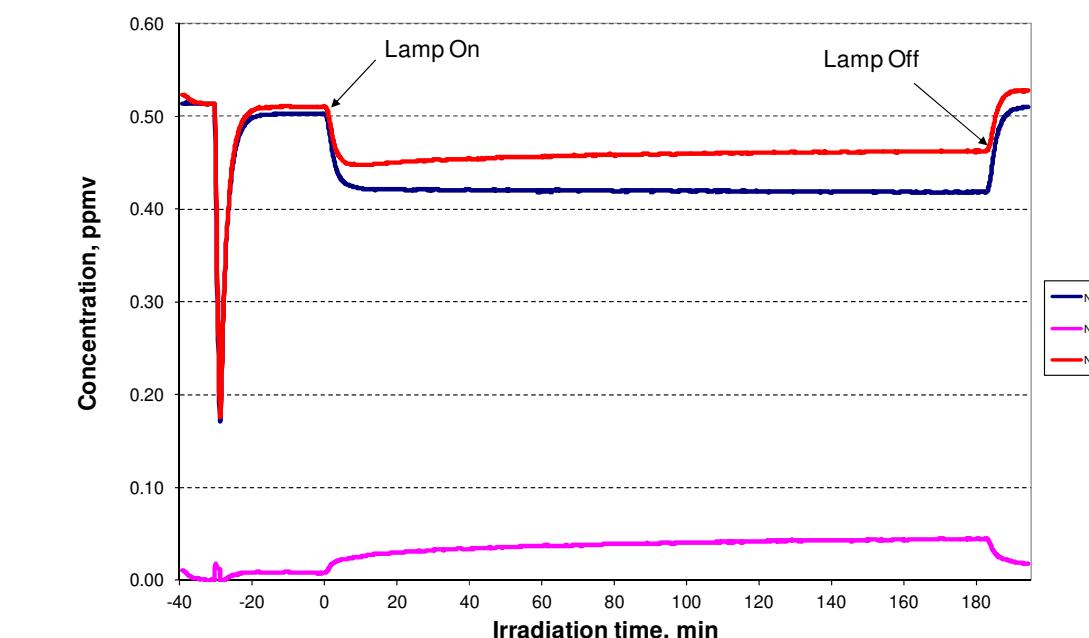

Figure 6. Concentration vs time for NO, NO<sub>2</sub> and NO<sub>x</sub> during the photocatalytic test on CR (UV) sample. Test dated 01/06/2020 and performed with UV irradiation in accordance with UNI 11484 (simplified).

### 3.4. Sample "AR" (UNI 11484, Visible)

The following table shows the operating conditions used in the test and its results.

Initial concentration of nitrogen oxides before entering the reactor	$C_{NO}^{IN} = 0.506 \text{ ppmv}$
	$C_{NO_2}^{IN} = 0.001 \text{ ppmv}$
Gas flow	$F = 1.608 \text{ dm}^3 \text{ min}^{-1}$
Temperature inside the reactor	$T = 33.3 \text{ }^\circ\text{C}$
Relative humidity inside the reactor	$HR\% = 37.3$
Irradiance of the lamp to the sample surface (in the VISIBLE range 400-800 nm)	$I = 250 \text{ W m}^{-2}$
Time elapsed between the time the VIS lamp is switched on and the start of the concentration recording	32 min
Conversion in the absence of sample	$C_{NO}^{OUT,BUJO} = 0.5036 \text{ ppmv}$ $C_{NO_2}^{OUT,BUJO} = 0.016 \text{ ppmv}$ $C_{NO_x}^{OUT,BUJO} = 0.4972 \text{ ppmv}$ $\eta_{NO,lamp}^{foto} = 1.3 \%$
Conversion in the dark in the presence of a sample	$\eta_{NO}^{buio} = -1.5 \%$ $\eta_{NO_2}^{buio} = 0.4 \%$
Conversion under radiation in the presence of a sample	The graph showing the evolution of the concentrations during the various test steps is shown in Figure 7.
Observed rate of photocatalytic degradation	See Table 2
Remarks	none

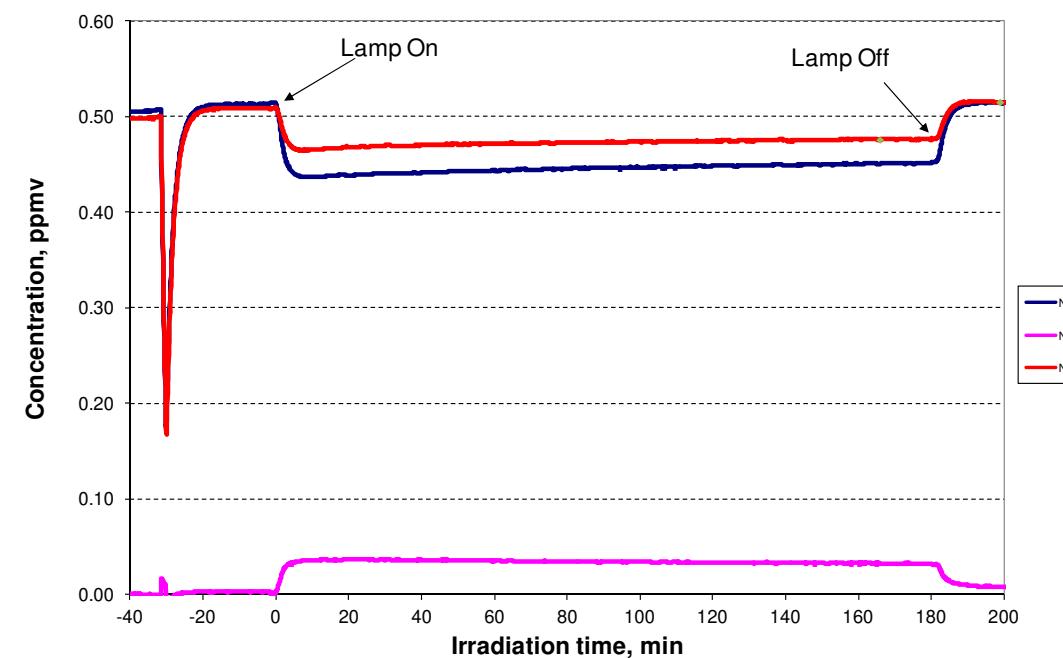

Figure 7. Concentration vs time for NO, NO<sub>2</sub> and NO<sub>x</sub> during the photocatalytic test on AR (Vis) sample. Test dated 03/06/2020 and performed in accordance with UNI 11484 (simplified) with VIS irradiation.

### 3.5. Sample "BR" (UNI 11484, Visible)

The following table shows the operating conditions used in the test and its results.

Initial concentration of nitrogen oxides before entering the reactor	$C_{NO}^{IN} = 0.513 \text{ ppmv}$
	$C_{NO_2}^{IN} = 0.001 \text{ ppmv}$
Gas flow	$F = 1.608 \text{ dm}^3 \text{ min}^{-1}$
Temperature inside the reactor	$T = 33.4 \text{ }^\circ\text{C}$
Relative humidity inside the reactor	$HR\% = 36.6$
Irradiance of the lamp to the sample surface (in the VISIBLE range 400-800 nm)	$I = 250 \text{ W m}^{-2}$
Time elapsed between the time the VIS lamp is switched on and the start of the concentration recording	45 min
Conversion in the absence of sample	$C_{NO}^{OUT,BUJO} = 0.5036 \text{ ppmv}$ $C_{NO_2}^{OUT,BUJO} = 0.016 \text{ ppmv}$ $C_{NO_x}^{OUT,BUJO} = 0.4972 \text{ ppmv}$ $\eta_{NO,lamp}^{foto} = 1.3 \%$
Conversion in the dark in the presence of a sample	$\eta_{NO}^{buio} = -0.3 \%$ $\eta_{NO_2}^{buio} = -0.7 \%$
Conversion under radiation in the presence of a sample	The graph showing the evolution of the concentrations during the various test steps is shown in Figure 8.
Observed rate of photocatalytic degradation	See Table 2
Remarks	none

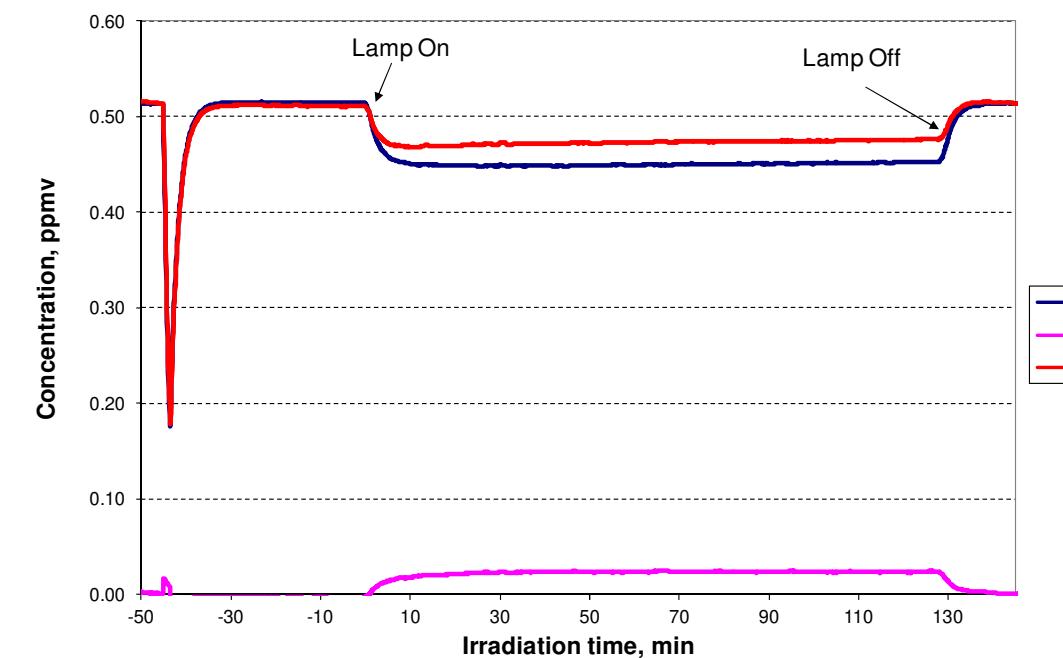

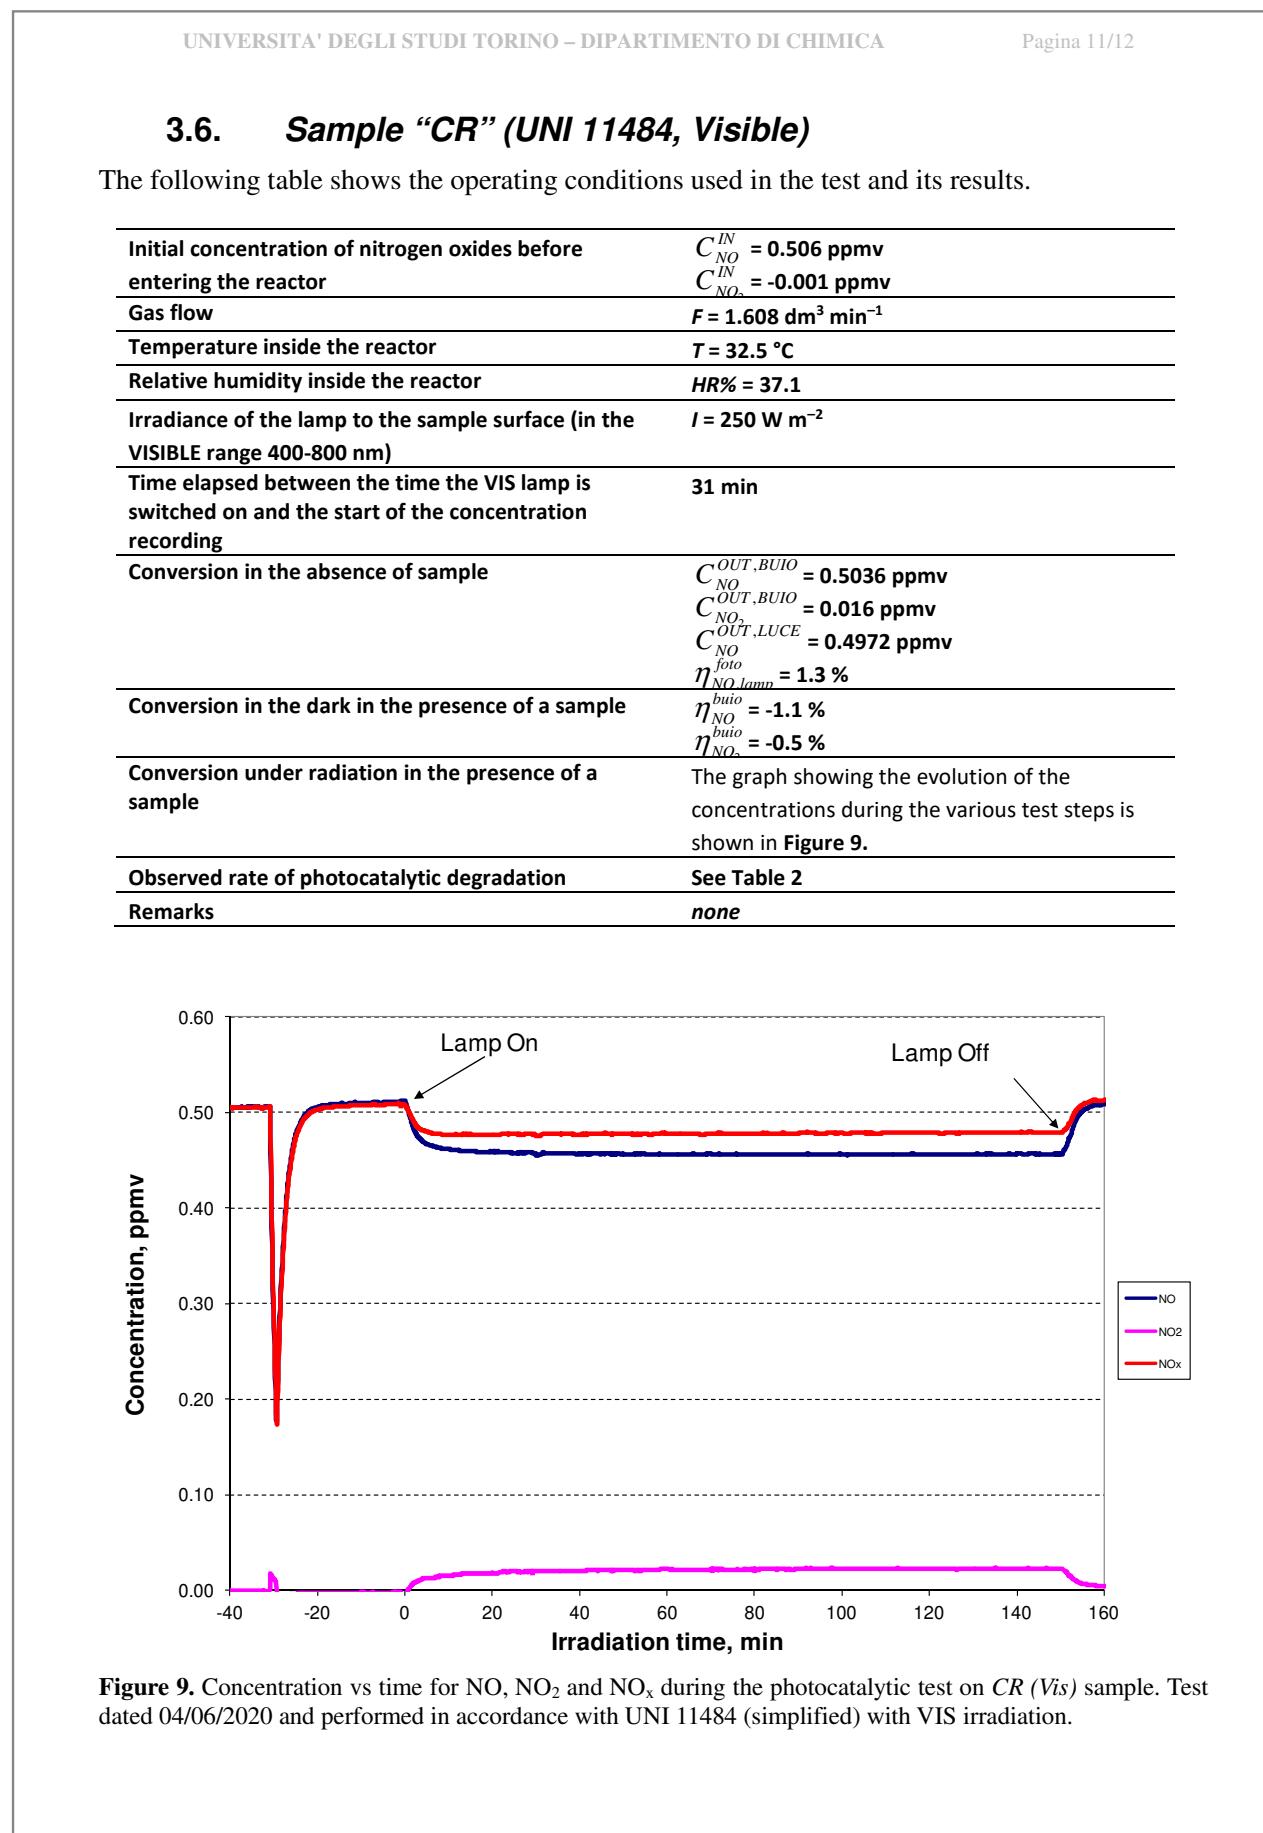

Figure 8. Concentration vs time for NO, NO<sub>2</sub> and NO<sub>x</sub> during the photocatalytic test on BR (Vis) sample. Test dated 03/06/2020 and performed in accordance with UNI 11484 (simplified) with VIS irradiation.

UNIVERSITA' DEGLI STUDI TORINO – DIPARTIMENTO DI CHIMICA Pagina 12/12

### 4. SUMMARY OF RESULTS

The specimens showed a measurable NO abatement under UV and Visible irradiation. The results of measurements of the photocatalytic activity according to UNI 11484 under UV (no pretreatment) and Visible irradiation (after washing with water) of the 3 samples are summarized in Table 2 (for NO/NO<sub>x</sub>). The conversions and rates are reported as average values calculated after 180 minutes of irradiation or when the stability of the conversion is attained in accordance with the UNI 11484.

**Table 2.** Measurement results. The conversions refer to the measured values after 180 minutes of irradiation

Sample	Irradiation	$\eta_{NO,i}^{total}, \%$	$\eta_{NO_x,i}^{total}, \%$	$r_{NO,i}^{foto}, \mu\text{g m}^{-2} \text{ h}^{-1}$	$r_{NO_x,i}^{foto}, \mu\text{g m}^{-2} \text{ h}^{-1} [i]$
AR(UV)	UV	20.7	11.2	1450	1130
BR(UV)	UV	17.9	9.3	1370	1140
CR(UV)	UV	18.5	9.9	1240	1060
AR(Vis)	Visible	10.9	4.7	820	640
BR(Vis)	Visible	11.8	7.2	830	720
CR(Vis)	Visible	9.8	5.3	720	590

[i] The photocatalytic NO<sub>x</sub> conversion rate is expressed as  $\mu\text{g}$  equivalents of NO<sub>2</sub> converted per  $\text{m}^2$  of sample in 1 hour.

Torino, June 8, 2020

Prof. Claudio Minero

## Produkt Zertifizierungen

100%  
DESIGN AND PRODUCTION  
OF ITALY

Certificazione obbligatoria per l'esportazione in  
Cina. Certification mandatory for export to China.  
Certification obligatoire pour l'exportation en Chine.  
Für den Export nach China obligatorische Zertifizierung.  
Certificación obligatoria para la exportación a China.  
Обязательная сертификация для Экспорта в Китай.

Tutte le piastrelle sono certificabili MOCA. All the tiles can be MOCA-certified. Toutes les carreaux sont certifiés MOCA.  
Alle Bodenfliesen sind nach MOCA zertifizierbar. Todas las baldosas pueden ser certificadas MOCA.
